operatively positioned downstream of a basal promoter comprising a letracycline operator. The TREVs can be used to produce stable cell lines in which gene expression is tightly regulated by tetracycline. They can be used for the production of proteins such as tumour suppressor proteins which can be used for the area for treating discusse characterised.
                                                                                                                                                                                                                                                                        The present sequence appears in the specification, which destities a retracycline responsive expression vector (TREV), which contains a sequence encoding a fusion protein comprising a transcriptional transcriptional (TDA) expression acts and the contains transcription demain (TDA) exertainely attacked to a tetracycline repression protein (TRE), the first sequence appears to promoter. The vector also contains a cloning site
                                                                                                                                      New fetracycline responsive expression sectors used for the tightly controlled expression of genes, such as tumour suppressor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          BD/NK4 pathway, especially an RD/P16.NK4a pathway. The oncoprotein MDM2 is a celular inhibitor of RD/E2F function and the p5 time as suppressor and can also be used in the methods, other molecules which can be used include cdk4 or cdk6 mutants. In particular, a cdk4 mutant is one which dillers from at one or more of residues K22, R24, H95 and/or P97.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          e.g. the number of mitotic divisions, of a cell. The method relies on activation of a telemerase activity and inhibition of one or both of a retinoblastonm (RD)/INKA pathway or a p53 pathway. Phosphorylation of the by cyclin dependent kinases, cdk4 and cdk6, releases the cells into the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention concerns methods and reagents for extending the life span.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              comprises administering agents reversibly activating telomerase activity and received \mu_1 and received \mu_2 and received \mu_3 and \mu_3 and received \mu_3 and \mu_3 a
                                                                                                                                                                                                                                                                                                      1000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      division cycle. Binding of INK4 family members, e.g. the tumour suppressor pl6INK4a, inhibits kinase activity and results in growth arrest. Rb isactivators can selectively and reversibly inactivate an

Additional constructs include a papilloma virus B7 protein, or other viral one operation which bypasses Rb and/or p53. Antisense constructs of the Rb and p161NK4 appess may also be used. The methods are useful for increasing the proliferative expansity of cells the sells are subsequently of use in pharmaceutical and cosmetic preparations used to treat conditions related to (premature) ageing, e.g. magular degeneration and affections of the vells can also be used to replace tumour cell lines in vitro and for studies on biochemical and physichopical aspects of incoming and differentiation. Long lived (immortal) cells could also be ase in the production of normal or genelically engineered biotechnology products.

facilitate the development of screening assays to evaluate the potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       designated Rb. Androgen receptor co activator proteins from the present invention can be used in screening assays to identify candidate pharmaceutical molecules for the ability to promote or inhibit the interaction of androgen receptors and androgen responsive themselves to modulate androgenic activity. The identification and claracterisation of androgen receptor such as those of the invention will

The present invention describes a method (ML) for screening for an auti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in comprises a sequence (S) selected from B47 sequences (H) comprises a sequence (S) selected from B47 sequences (H) where a change in to ABC70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has eyrostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a

result of M1, and the data is sufficient to convey the chemical structure and/of properties of the adent. M1 can be used in the refunct of cancer such as colon, breast, stomach, lung, thyroid, besophageal, ovarian, Kidney, prostate or pancreatic cancer, adentocarchoma, carchoma, clear cell cancer, infiltrating ductal cancer, squamous cell carcinoma, neuroendocrine

Diagnosis of retinoblastoma - using genetic material corresp. to a normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           neophism. It is used to produce an antibody to the protein, contacting this with the tumour sample and detecting immune complexes as indication of the presence in the tumour sample of the protein. Whole sequence or a unique sub-region can be used. The method identifies patients lacking the defective retinoblastoma (Rb) allele and thus are not at risk of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This gene encodes a protein, the absence of which is associated with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  67 ACATGTGAAC FFATATTTGACAGCAACCCAGTTCATATCTACTGAATAATTCT 126

This sequence encodes a modified relinchastome tumour suppressor protein (RISP) of the invention. The proteins can be used for inhibiting collular proliferation, when coadministrated with a psa protein. The PISBs out to used for treating diseases characterised by abnormal cellular proliteration, particularly cancers. The RISPs have a broader spectrum of activity than wild type RISPs.
                                                                                                                                                                                                                                            Kerin blastoma suppressor protein with N-terminal modification - inhibiting cellular proliferation, particularly cancel

```
The sequence is that of the retinoblastoma gene which encodes the retinoblastoma (RB) protein which may be used as part of a method of controlling cell cycle progression which may be used in combination with therapeutic methods to arrest tumour decreases in organisms. The cell cycle can be reversibly arrested in a convenient and sate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         manner. The protein is used in a compan, is relatively inexpensive and readily obtainable, and shows little or no toxic effects on healthy cells. It is also compatible with other methods and devices for regulating certain physiological processes of the body, such as blood cell produ, and gamete produ. Fraqments of the protein are soluble in low conens, of alycerol thus enhancing their value in

This nucleotide sequence includes a coding region for retinoblastoma protein RB (see AAM62465). A new claimed polypoptide is a fusion of: (i) a transcription lactor (TP) comprising a DNA binding domain, and (ii) a retinoblastema (Rb) polypoptide that includes a growth suppression domain. Also new are: (i) a nucleic acid emoding the fusion protein, and (2) expression vectors containing such DNA. The fusion protein, particularly expressed from gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   81 ValSerSerValAspGlyValLenGlyClyTyr:14cOntysLynClyGGGAAcolTrpCly 100

```
tool for diagnostic retinoblastoma. Rh eDNA or genomic DNA are preferably waved as probes to determine the detect region of the mRB gene through genomic DNA blotting analysis or using the method of restriction tragment length polymorphism analysis to determine the diseased allele. Glored RB enth can be used to generate specific anti-RB protein (anti-ppRBIB) and thooless which are useful immunoscretering of tissue biopsy. The diagnostic method is particularly intended for use in screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RM gene; human; retinoblastoma gene; mutation detection; immunoscreening; retinoblastoma diagnosis; hereditary retinoblastoma; secondary cancer; esteosarcoma; glioblastoma; breast cancer; lumentiquenesis suppression; sa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of detecting a mutated retinoblastoma (minth) merbic acid in mannals comprising hybridizing an isolated that length, wild type MF WIKH) for probe to a cell sample and detecting a mutated RH nursicle acid. The method is useful as a diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cancer, such as, ostrosarcoma, fibrosarcoma, glioblastoma, breast cancer whether or not connected with retinoblastoma. The method is also used in the suppression of fullouding-resis where the absent RB protein ppRRHIO will be provided through the molecular induction and quier transplanting of the RB cDNA to the individual in need of ppRBHIO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      families with a history of hereditary refinchlastoma and for screening their children. It may also be used in prophylactic and postnatal screening and for the prediction of the development of secondary

the present invention describes a composition comprising a recombinant ademovirus expression vector, where the vector has an insert of excapance Long comprising a game encoding a forting mand protein and ademovirus DNA in which all of the coding sequences of Elb, Elb, and protein iX, and part of E3 are deleted. The vectors are useful in gene therapy frequencing of cancer, especially for treating p53 deficient tumnours. The vector enables safer and more efficient gene therapy of cancer. The present sequence encodes human p110-RB refinoblastoma bunour suppressor which can be used as the foreign gene in the above

Sequence 2995 BB; 975 A; 618 C; 593 G; 809 T; 0 other;

```
comprising a deletion in the protein IX gene and a gene encoding a forcign protein. This vector can be used in gene therapy, particularly throduce tumoun suppressor genes into cancerous cells. Genes which may be used include F23, thymiline kinase and retinoblastoma tumour suppressor gene (Rb). The present sequence is the retinoblastoma tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant adenovirus expression vector comprising a partial or total deletion of a protein IX DNA and a gene encoding a toreign protein e.g. suicide protein, useful for inhibiting or reducing the proliferation of

characterised by the partial corteral deletion of the adenoviral protein to TN NAM Expression and a foreign protein of the adenoviral protein having a gene encoding a foreign protein when as tumour suppressor protein, pl10RB (retlinoblastoma) and p53. Adenovirus vector is used protein, pl10RB (retlinoblastoma) and p53. Adenovirus vector is used in spraticularly useful for treating uniour suppressor genes useful in gene therapy. The vector is particularly useful for treating useful for treating useful for treating the protein such as thyroid hyperplasia, Grave's disease, psoriasis, hepatocellular carbinoma, neophlasms, leukaemias, lymptomas, etc. to inhibit tumour proliferation or to ameliorate particular related and bathology such as slocks cell anaemia and Tay-Sachs disease. The vector is also useful for the safe tecombinant production of diagnostic and therapeutic polypeptides and proteins.
                                                                                                                                                                                                                                                                                                                                  New recombinant adenovirus expression vector having a gene encoding for a foreign profein and a partial or total deletion of the adenoviral profein IX DNA, useful in gene therapy for treating or reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present fond sequence encodes retinitiastima (BD) tumour suppressor

The present invention describes a recombinant adenovirus expression vector, which comprises a partial or total deletion of a protein IX DNA and a given excepting fretein. The recombinant adenovirus vector can have expression rector is particularly useful for treating or suppressing proliferation of a tumour, e.g. non-small cell lung cancer, small cell lung cancer, small cell lung cancer, small cell lung cancer, breater tumour, bladder tumour, colorectal carcinoma, sarroma, prostate tumour, bladder tumour, colorectal carcinoma, sarroma, tissues, Wilm's tumour, astrocytoma, glioblastoma, neuroblastoma, colorectal carcinoma, colorectal carcinoma, sarroma tissues, Wilm's tumour, astrocytoma glioblastoma, neuroblastoma, osteosationa of texal cancer. The present sequence encodes the retinoblastoma tumour suppressor protein pilo-RB, which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      121 Clnt.gsAsnilcCluffeSerValHistgsPhePheAsnicuLcatgsGluffeAsplhr 140

The vector also contains a clouing site operatively positioned downstream of a basel positioned downstream of a basel positioned as

treat conditions related to (premature) ageing, e.g. machlar degeneration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention concerns methods and readents for extending the life-span, e.g. the number of mitoric divisions, of a cell. The method relies on activation of a telemerase activity and inhibition of one or both of a retinoblastoma (Rb)/INR4 pathway or a p53 bathway thosphorylation of Rb by cyclin-dependent kinsses, c4k4 and c4k6, releases the cells into the division cycle. Binding of INR4 lamily members, e.g., the tumour suppressor placing of inhibits kinase activity and results in growth arrest. Rb inactivators can selectively and reversibly inactivate an Rb/INR4 pathway, especially an Rb/Pl6:NR4a pathway. The encoprotein NDM2 is a cellular inhibitor of Rb/EEF function and the p53 timour suppressor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     lines in vitro and for studies on biochemical and physiological aspects of growth and differentiation. Long lived (immortal) cells could also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               and can also be used in the methods, other molecules which can be used include cdk4 or cdk6 mutants. In particular, a cdk4 mutant is one which differs from at case or mote of residues E22, E24, E34, E34 and/or D97. Additional constructs include a papilloma Virus E2 protein, or other vira! oneogratein which Expasses E0 and/or P64. Antisense constructs of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       increasing the proliferative capacity of cells. The cells are subsequently of use in pharmaceutical and cosmetic preparations used to
                                                                                                                                                                                                                                                                                                                                                                                                                    comprises administering agents reversibly activating recommense activity and reversibly idactivating ALCIAN and Gerpsthays useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 and arteriosclerosis. The cells can also be used to replace tumour cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the Rb and pl61NK4a genes may also be used. anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (1) of a standard green set, where (1) comprises a sequence (S) selected from 6447 sequences (qiven in ABL51664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (1) has vivositaric activity and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a structure and/or properties of the agent. MI can be used in the testil of cancer such as a structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyrotd, ocsophageal, ovarian, kidney, prostate or panereatic cancer, adenocarcibona, carcibona, elear cell cancer, intilitatina doublar cancer, aquambas cell carcibona, neutrendo rine carcibona, papillary carcibona and Wilm's tumour. 177 161 ILeCystiePhelleAiaAlaValAsploudlyAspMetSerPbethrPhethrGlubeu 120 121 GlutysAsnileGluffeSerValHistysPhePheAsnieutysGluffeAspThr 140 557 141 SerThrLysValAspAsnAlaMetSerArqLeuLysLysTyrAspValLeuPheAla 160 21 ProAlaProProProProProProGlaslaAspFrosluslnAspSerslyProGlu 40 61 CysginLysiculysfleProAspHisValArqGluArqAlaTrpLeuthrTrpCluEys 80 1 MetProProLysThrProArgLysThrAlaAlaThrAlaAlaAlaAlaAlaAlaAlaGluPro 20 41 AsplieuProLeuValArgileuGluPheGruGluThrCluGluProAspPheThrAlaLeu Sequence 4839 BP: 1534 A: 902 C: 880 G: 1523 T; 0 office; Connervative: Mismatches: Matches: indels: US:09 026 459A 51 (1 928) x ABL62873 (1:4839) 4787,00 49.84% 49.78% 44.77% Percent Similarity: Best Local Similarity: Aliqument Scores: Query Match: Pred.
